

The **CheckAge** middleware in the app/Http/Middleware folder checks the user's age when they make a request. If the user is under 18, they get redirected to another page (like an "access denied" page). If they're 18 or older, they can continue with their request without any issues.

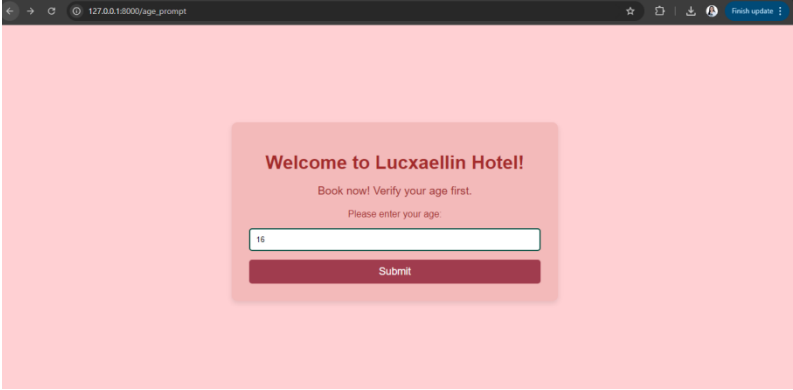

The **LogRequest** middleware in the app/Http/Middleware folder records details about each incoming request, like the URL and method used. After logging this info, it lets the request continue normally.

The **web.php** file is where the routes are stored

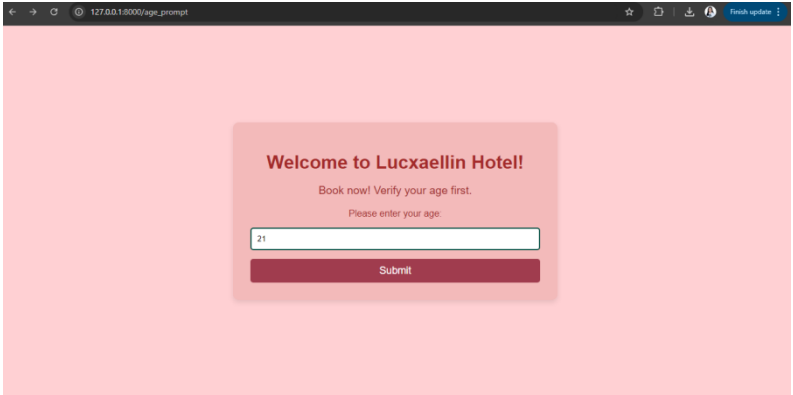

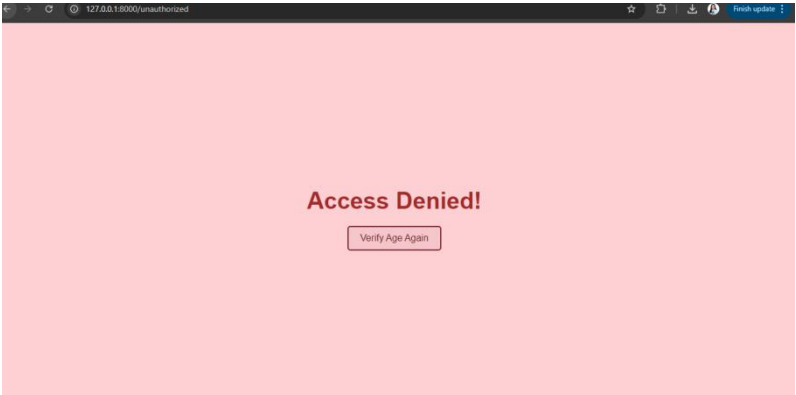

## Rendered Webpage

It shows a page where you need to enter your age to access the Luxxaellin Hotel website. The user entered "16" and clicked submit.

This page appears if the user submits their age and it turns out they don't meet the minimum age requirement (likely 18 or older), denying them access to the ordering system. The user can click the button to try again and enter a valid age.

The page show where you need to enter your age to access the Luxxaellin Hotel website. The user entered "21" and clicked submit.

If the user is 21 or older, they are automatically redirected to the hotel's homepage after submitting their age.
